

EMI Test Receivers ESHS 10 and ESVS 10

ESHS 10: 9 kHz to 30 MHz

ESVS 10: 20 MHz to 1000 MHz

Test receivers for commercial

EMI measurements

ESHS 10 (photo 42407)

Brief description

The receivers ESHS 10 and ESVS 10 are suitable for measuring electromagnetic interference in line with commercial standards:

- CISPR 16, VDE0876 and ANSI C63.2
- EN55011 to 55022, ETS, FCC, VCCI and VDE 0871 to 0879 and ANSI C63.4

Applications

The instruments are ideal for routine tasks in industry such as development and approval tests in line with commercial standards. Featuring mains-independent battery powering, they are also suitable for mobile applications at EMC service providers, test houses and safety standard authorities.

Main features

Superior circuit design

- High measurement accuracy, typical error 0.5 dB
- Wide dynamic range, typical noise figure 7 dB with preamplifier, third-order intercept point 20 dBm (without preamplifier)

- Calibrated attenuator with high pulse loading capacity, switchable in 10-dB steps from 0 to 120 dB
- Comprehensive preselection filters
- Switchable preamplifier with wide dynamic range
- Crystal-stabilized, fast synthesizer with high resolution and sweep mode for fast frequency scanning
- High-level mixer with high oscillator rejection
- Delay-equalized IF filters

Demodulation

- Parallel detectors for average, peak and quasi-peak indication
- 60 dB operating range also for quasi-peak and average value indication
- Highly linear envelope detector with more than 70 dB dynamic range
- AM and A0 demodulators (ESVS also FM)
- Logarithmic amplifier with more than 70 dB dynamic range
- Peak indication with automatic consideration of IF bandwidth correction values for broadband interference measurements

- Automatic overload detection in mixer stages and in test channel by permanently activated peak detectors

Powerful processor system

- Manual operation or internal or external processor control
- Flash EPROMs for convenient and fast firmware update through PC
- Macros for automatic and semi-automatic test runs
- Automatic level calibration
- Automatic consideration of frequency-dependent transducer factors
- All built-in functions fully programmable via IEC/IEE bus
- Fast measurement in external trigger mode; output of up to 5000 values/s via IEC/IEEE bus, up to 400 values/s including frequency change within certain frequency bands
- 12-bit A/D converter with short conversion time, measurement time selectable between 1 ms and 100 s
- High measurement accuracy thanks to automatic total calibration
- Automatic monitoring of all synthesizer loops and supply voltages during operation

EMI Test Receivers ESHS 10 and ESVS 10

Optimum result display and printout

- Measurement of voltage, field strength, current and pulse spectral density with display of relevant units
- Indication of result on analog meter or digital display with 0.1 dB resolution
- Output of results as lists and diagrams on printer including limit lines

Further features

- Digital level indication on LCD and analog level indication on moving-coil meter taking into account transducer factors and their units
- Numerous interfaces for driving or feeding additional devices
- AC supply as well as battery powering for mobile applications

Operation

RFI field-strength and RFI power measurements

For solving complex EMC problems, manual measurement often is the most efficient way, since the operator can make full use of his experience in identifying interference sources. The receivers fea-

ture conventional test receiver operation with tuning knob, indication of results on a meter and built-in loudspeaker.

Nonvolatile storage of 22 limit lines and transducer factors with up to 50 values is possible. By combining the transducer factors, all test configurations occurring in practice can be covered.

Macros for semi-automatic test runs (ANALYSIS OPTIONS) match the test receivers to the specific configuration, device under test and test specification. Being thus prepared, the test receivers perform the following routines:

- Fast prescan measurement using peak or average detector
- Determination of critical frequencies by means of limit lines with data reduction to shorten the measurement time
- Final measurement at critical frequencies using average and/or peak detector
- Output of results on printer

The test receivers offer a choice between automatic, semi-automatic and user-controlled test runs. Scan options are available for prescan measurements, data reduction and final measurements.

Data reduction is the main criterion for optimizing the test run. It is the link between prescan interference measurement and correct weighting with test parameter variation (final measurement) to reduce measurement time. There are also scan options taking account of the test configuration, for instance measuring RFI voltage with LISNs, RFI power with an absorbing clamp and RFI field strength with antennas.

Design

The modular design of the test receivers provides excellent RF shielding and great convenience for servicing. An extremely low-noise, temperature-controlled fan ensures low self-heating. The comprehensive selftest functions allow easy identification of a faulty module which can be replaced with a minimum of effort and without affecting the other modules.

Specifications in brief: ESHS

Frequency range	9 kHz to 30 MHz
Frequency setting	in 10 Hz, 10 kHz steps or user-selectable step size for RF analysis
Automatic scan	7-digit LCD
Display	10 Hz
Resolution	$<3 \times 10^{-6} + 30$ Hz
Frequency drift	
RF input	N connector, 50 Ω
VSWR	<1.2 with 10 dB RF attenuation, <2 with 0 dB RF attenuation
Preamplifier	10 dB, can be connected between preselector and 1st mixer
Preselector	5 fixed-tuned filters
Maximum input level (with and without preamplifier, RF attenuation ≥ 10 dB)	
DC voltage	7 V (corresp. to 1 W)

Sinewave AC voltage	137 dB μ V
Max. pulse voltage (10 μ s)	700 V
Max. pulse energy (10 μ s)	100 mWs

Interference rejection, nonlinearities

Image-frequency rejection	
1st IF	>90 , typ. 100 dB
2nd IF	>75 dB
IF rejection	>90 , typ. 100 dB

Intercept point d3 with $|f_1 - f_2| > 100$ kHz

and 0 dB RF attenuation	preamplifier off	preamplifier on
Level (f_1, f_2) at receiver	2x -10 dBm	2x -20 dBm
$f_m < 2$ MHz	typ. 15 dBm	typ. 0 dBm
$f_m \geq 2$ MHz	>15 dBm,	>0 dBm,
	typ. +20 dBm	typ. +5 dBm

Intercept point k2

>40 dBm	>20 dBm
